

# Coproduction Learning Health Systems: Empowering and Accelerating Real-World Improvement, Leadership, and Research

Brant Oliver, PhD, MS, MPH, FNP-BC, PMHNP-BC

*12<sup>th</sup> Annual Nursing Research Evidence-Based Practice Symposium*

[brant.j.oliver@dartmouth.edu](mailto:brant.j.oliver@dartmouth.edu)

October 29, 2021

## About your keynote speaker...

MS specialist (MSCN) nurse practitioner (FNP, PMHNP) with 18 years experience in in MS clinical care, subspecializing in neurobehavioral health.

Chronic Health Improvement Research Program

Director, Chronic Health Improvement Research Program at Dartmouth

- Associate Professor at Geisel School of Medicine and the Dartmouth Institute
- Associate Chief Quality Officer for Patient Experience at Dartmouth-Hitchcock

National core faculty for Department of Veterans Affairs VAQS and HPEER post-doctoral fellowship programs in healthcare quality, improvement science, and health systems redesign. Leads national improvement methods and analysis curriculum for the VAQS fellowship program.

MS-CQI COLLABORATIVE  
IMPROVING MS CARE TOGETHER

Principal Investigator of the first national multi-center healthcare improvement science research collaborative (2017-2020) for MS in the United States (MS-CQI).

# Overview

- Learning about us
- The problem of “one more thing”...
- Setting the stage for Coproduction Learning Health Systems
- Building a Coproduction Learning Health System
- Example: The MS-CQI Collaborative
- Breakout discussions
- A new equation...

# Learning about us...

*Two poll questions:*

- 1) What activities are you engaged in?
- 2) What gets in the way?

# The Problem of “One More Thing”

# A system designed to learn slowly...

*“Every system is perfectly designed to get the results it gets.”*

Paul Batalden\*

Professor Emeritus, the Dartmouth Institute (TDI)

Co-Founder and Senior Fellow, Institute for Healthcare Improvement (IHI)

*On average, it takes between 17-19 years to get a new evidence based treatment or intervention from bench to bedside, and even after it gets implemented, there is substantial variation in how it is implemented in actual practice... we have to accelerate implementation and simultaneously study it...*

\*Dr. Batalden is considered by many to be one of the leading scholars in the development of the modern quality improvement era in healthcare. His accomplishments include clinical microsystems theory and most recently, healthcare coproduction theory. He founded the IHI along with Don Berwick.

6

# Systems focus is relatively new...

Biomedical and health sciences research and development has historically been based in three silos (and these remain the predominant categories now)...

1. Bench
2. Clinical trials
3. Population-based epidemiology

Systems-level research emerged in the latter half of the 20<sup>th</sup> century, prompted by the pivotal IOM reports “*To Err is Human*” (safety) and “*Crossing the Quality Chasm*” (quality), which described the failure of the U.S. healthcare system to attain high quality and safety standards despite having the most resources dedicated to healthcare of any industrialized nation.

*IOM recommendations: The future of healthcare is in Learning Health Systems*

# Context is everything...

Wennberg's seminal health policy research on "small area variation" exposed a new reality and created a new focus on systems and variation... he found that evidence based practice is often overshadowed by local practice culture and environmental context...

- Supplier-induced demand
- Unwarranted variation in utilization
- Over- and underutilization of evidence-based care
- Social and behavioral determinants of health

*"Geography is destiny" - John Wennberg\**

# Towards System Level Outcomes

AHRQ Healthcare Quality Domains:  
<https://www.ahrq.gov/talkingquality/measures/six-domains.html>

## *IOM Domains of Healthcare Quality*

- Safe:** Avoiding harm to patients from the care that is intended to help them.
- Effective:** Providing services based on scientific knowledge to all who could benefit and refraining from providing services to those not likely to benefit (avoiding underuse and misuse, respectively).
- Patient-centered:** Providing care that is respectful of and responsive to individual patient preferences, needs, and values and ensuring that patient values guide all clinical decisions.
- Timely:** Reducing waits and sometimes harmful delays for both those who receive and those who give care.
- Efficient:** Avoiding waste, including waste of equipment, supplies, ideas, and energy.
- Equitable:** Providing care that does not vary in quality because of personal characteristics such as gender, ethnicity, geographic location, and socioeconomic status.

# Towards Learning Health Systems

- Small area variation >> focus on systems impact on population health
  
- Systems focus + system-level measurement + informatics (EHRs) >>> registry-enabled Learning Health Systems (LHS)
  
- How to study and influence Learning Health Systems
  - Benchmarking
  - Innovation
  - Improvement
  - Implementation
  - EBP

# Whole system measurement: Present and future...

**Background:** The IBD Qorus Collaborative aims to reduce variation and increase the value of care for the adult inflammatory bowel disease (IBD) community. To evaluate the success of the collaborative, we aimed to develop a balanced set of outcome measures that reflect a multistakeholder view of value in IBD care. To achieve this, we used the Clinical Value Compass framework and engaged a mixed-stakeholder group to conduct a modified Delphi process. The end result was a 10-measure set to assess the value of IBD care.

**Method:** The modified Delphi process included 3 iterative rounds of blinded voting and interactive webinar-style discussion. We recruited 18 participants for the Delphi panel, including clinicians, researchers, patients, Crohn's & Colitis Foundation staff, and payers. Participants first identified constructs to measure, then identified the tools to measure those constructs. A literature review and environmental scan of current measures in 4 domains were performed, and relevant measures were proposed for discussion and voting in each domain. Throughout the process, participants were invited to contribute additional measures.

**Conclusion:** The modified Delphi process led to selection of 10 value measures across 4 domains: (1) patient experience, (2) functional status, (3) clinical status, and (4) health care costs and utilization. We have successfully completed a 3-stage modified Delphi process to develop a balanced set of value measures for adult IBD care. The value measure set expands upon prior efforts that have established quality measures for IBD care by adding cost and experience of care elements. The work positions IBD Qorus to better assess, study, improve, and demonstrate value at individual, system, and population levels and will inform and empower related research, improvement, and implementation efforts.

**Key Words:** inflammatory bowel disease, modified delphi process, value compass, patient reported outcome, patient reported outcome measure, patient reported experience measure, quality improvement, value measures

**Introduction**

Inflammatory bowel disease (IBD), including Crohn's disease and ulcerative colitis, is a costly, complex, and chronic inflammatory disease of the gastrointestinal tract that affects 3 million adults in the United States and significantly affects health-related quality of life.<sup>1,2</sup> Despite many evidence-based practice guidelines for the management of IBD,<sup>3</sup> significant variation exists in care processes, delivery, and outcomes across practitioners, health systems, and geographic areas.<sup>4</sup> This variation could contribute to underutilization or overutilization of health services and poor health outcomes for people with IBD, including increased morbidity and mortality.<sup>5</sup> Rapid collection and reporting of quality measures drives rapid improvement in the context of a learning health system,

**ABSTRACT**

**Introduction** Coproduction introduces a fundamental shift in how healthcare service is conceptualised. The mechanistic idea of healthcare being a 'product' generated by the healthcare system and delivered to patients is replaced by that of a service co-created by the healthcare system and the users of healthcare services. Fieldstad et al offer an approach for conceptualising value creation in complex service contexts that we believe is applicable to coproduction of healthcare service. We have adapted Fieldstad's value creation model based on a detailed case study of a renal haemodialysis service in Jonköping, Sweden, which demonstrates coproduction characteristics and key elements of Fieldstad's model.

**Methods and analysis** We propose a five-part coproduction value creation model for healthcare service: (1) value chain, characterised by a standardised set of processes that serve a commonly occurring need; (2) value shop, which offers a customised response for unique cases; (3) a facilitated value network, which involves groups of individuals struggling with similar challenges; (4) interconnection between shop, chain and network elements and (5) leadership. We will seek to articulate and assess the value creation model through the work of a community of practice comprised of a diverse international workshop with representation from executive, financial and clinical leaders as well as other key stakeholders from multiple health systems. We then will conduct pilot studies of a qualitative self-assessment process in participating health systems, and ultimately develop and test quantitative measures for assessing coproduction value creation.

**Ethics and dissemination** This study has been approved by the Dartmouth-Hitchcock Health Institutional Review

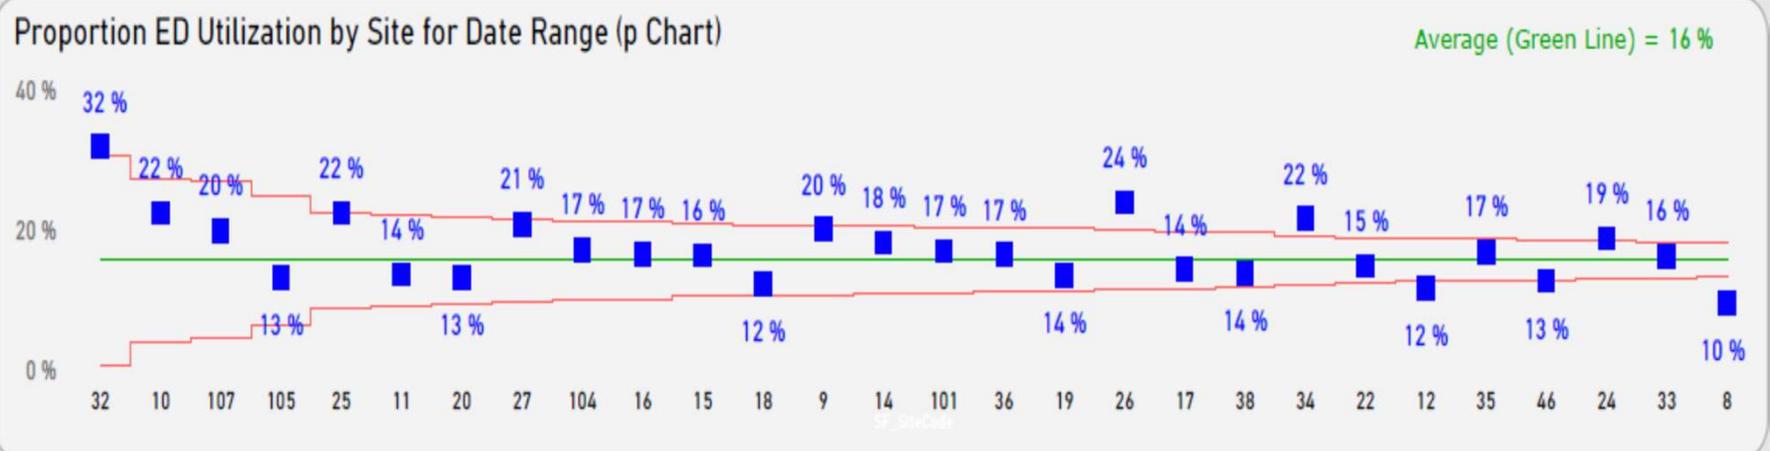

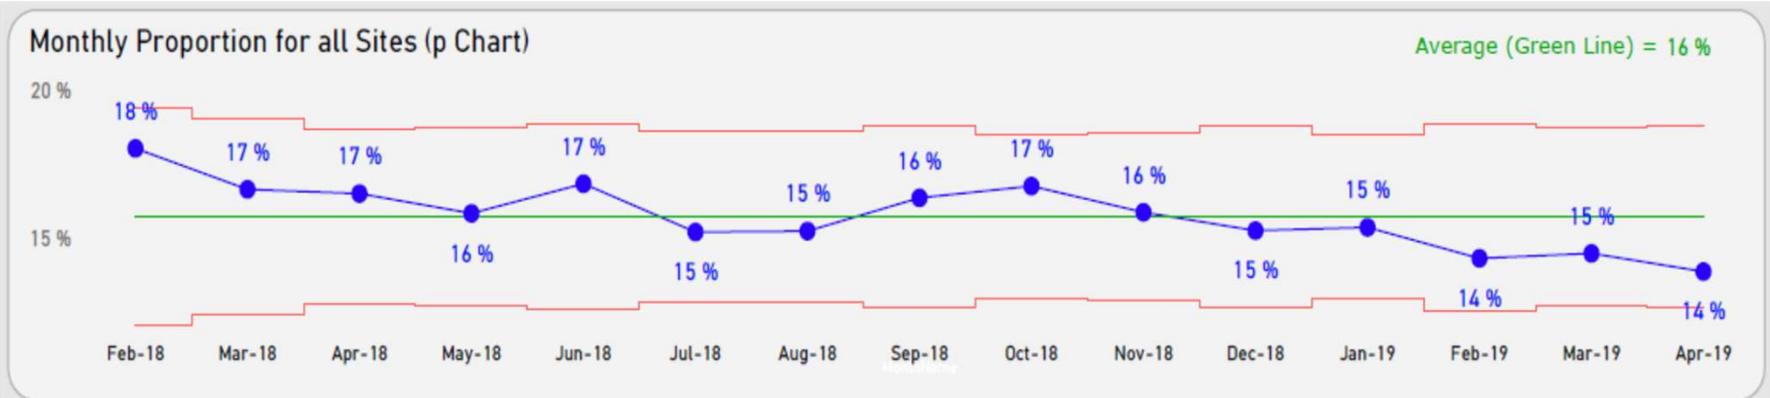

**Strengths and limitations of this study**

- The CO-VALUE study is an international, multicentre protocol adapting a novel conceptual model for coproduction value creation and assessment in healthcare services.
- The international, multicentre application of a value creation model for coproduction and its assessment in healthcare services could provide useful information for both applied and research communities.
- A community of practice consisting of executive, financial and clinical leaders as well as patients, facilitators and advocates from four countries has been established to guide each phase of this study.
- CO-VALUE is designed to leverage substantial diversity in participating health systems in hopes of yielding a generalisable model for coproduction value creation, but this large degree of diversity also introduces heterogeneity limitations.
- This is not an effectiveness study and is neither randomised nor blinded.
- Further, it aims to apply and optimize qualitative and quantitative methods for coproduction value creation assessment in initial evaluations of feasibility, usability and utility.

**ANALYSIS**

**Patient focused registries can improve health, care, and science**

Eugene Nelson and colleagues call for registries of care data to be transformed into patient centred interactive learning systems

Eugene C Nelson professor<sup>1</sup>, Mary Dixon-Woods professor<sup>2</sup>, Paul B Batalden professor<sup>3</sup>, Karen Homa researcher<sup>4</sup>, Aricca D Van Citters researcher<sup>1</sup>, Tamara S Morgan researcher<sup>1</sup>, Elena Ethimovska professor<sup>5</sup>, Elliott S Fisher professor<sup>1</sup>, John Ovreitveit professor<sup>6</sup>, Wade Harrison researcher<sup>1</sup>, Cristin Lind professor<sup>5</sup>, Staffan Lindblad professor<sup>4 5</sup>

<sup>1</sup>Dartmouth Institute for Health Policy and Clinical Practice, Geisel School of Medicine, Dartmouth College, 1 Medical Center Drive, Lebanon, NH 03766, USA; <sup>2</sup>Institute of Public Health, University of Cambridge School of Clinical Medicine, Cambridge, UK; <sup>3</sup>Dartmouth-Hitchcock Health, Lebanon, NH, USA; <sup>4</sup>Medical Management Centre, Karolinska Institutet, Stockholm, Sweden; <sup>5</sup>Quality Register Center Stockholm, Karolinska Institutet and Stockholm County Council, Stockholm, Sweden

Large scale collection and analysis of data on patients' experiences and outcomes have become staples of successful health systems worldwide. The systems go by various names—including registries, quality registries, clinical databases, clinical audits, and quality improvement programmes<sup>1–4</sup>—but all collect standardised information on patients' diagnoses, care processes, and outcomes, enabling systematic comparison and analysis across multiple sites. Hundreds of what we will term, for simplicity, "registries," now exist around the world. The United Kingdom is home to over 50 clinical audit programmes,<sup>5</sup> the United States has over 110 federally qualified registries certified to report quality metrics,<sup>6</sup> and Sweden, perhaps the registry epicentre, has over 100, covering conditions from birth to frail old age.<sup>7</sup> These registries have had far reaching effects. They facilitate public reporting, retrospective and prospective research, professional development, and service improvement. They reveal variations in practices, processes, and outcomes, and identify multiple purposes. Perhaps most problematic of all is that many registries have limited patient involvement in their design, oversight, or operations.<sup>8</sup> Patients may not be asked to identify their priorities for data to be collected, so the information generated may only partly reflect what matters to them.<sup>9</sup> Patients do not usually have access to the data collected (even when it is about them) or opportunities to add data outside medical encounters. This means they cannot use the data to support self management or shared decision making. Signs of change are, however, beginning to appear. The UK's Healthcare Quality Improvement Partnership (HQIP) has an explicit patient and public involvement policy, and now includes patient representatives when developing specifications for its registries. National clinical audits in the UK, like those in Sweden, the Netherlands, and elsewhere,<sup>10</sup> are also beginning to incorporate patient reported outcomes alongside clinical measures.<sup>11</sup>

An evolutionary pathway (from left to right): Wagner Chronic Care Model, Coproduction of Healthcare Service, and Registry-Enabled Coproduction Learning Health Systems

## Turning Feed-forward and Feedback Processes on Patient-reported Data into Intelligent Action and Informed Decision-making Case Studies and Principles

Brant J. Oliver, PhD, MS, MPH, APRN-BC,\*†‡§ Eugene C. Nelson, DSc, MPH,§||  
and Carolyn L. Kerrigan, MD, MHCDS,¶\*\*

**Introduction:** The creation of patient-reported outcome (PRO) in routine clinical practice provides opportunities to “feed-forward” the patient’s perspective to further clinical aims to inform planning and management. This data can also be aggregated to “feedback” population-level analyses that can inform treatment decision-making, predict or modify, population-level care, and system-level quality improvement efforts.

**Methods:** Aiming Interpretation and Acting on Results. These case studies demonstrate a number of system-level features which aid effective PRO interpretation: (1) feed-forward and feedback information flows; (2) score interpretation aids; (3) cascading measurement; (4) registry-enabled learning health care systems; and (5) the institutional development of information systems.

**Discussion:** The case studies describe the developmental uses of feed-forward PRO programs—from simple to mature applications. The Cleveland Hospital (CH) Multiple Sclerosis Neurobehavioral Clinic exemplifies a simple application in which PRO data are used before and during clinic visits by patients and clinicians to inform care.

The Dartmouth-Hitchcock (DHO) Spine Center exemplifies a mature program which utilizes population-level analysis to provide decision support by predicting outcomes for different treatment options. The Swedish Rheumatology Quality (SQ) Registry exemplifies an exceptional application which has spread to multiple systems across an entire strategy.

**Key Points:** Feed-forward and feedback PRO information systems can better inform, involve, and support clinicians, patients and families, and allow health systems to monitor and improve system performance and population health outcomes. Ideal systems have the capability for multi-level analyses at patient, system, and population levels, and an information technology infrastructure that is linked to associated workflows and a supportive practice culture. As systems mature, they progress beyond the ability to describe and inform towards higher level capabilities including prediction and decision support. Finally, there is additional promise for the integration of patient-reported information that is aligned (or weighted) by preference and values to guide shared decision-making and inform personalized precision health care in the future.

**Key Words:** feed-forward, feedback, patient-reported outcome (PRO), learning health systems (LHS), electronic health record (EHR), population health, health care quality improvement.

(Med Care 2019;57: S31–S37)

### KEY POINTS

Feed-forward and feedback patient-reported outcome (PRO) information systems can contribute to the development of learning health care systems (LHS), which are poised to better inform, involve, and support clinicians, patients and families, and empower health systems to monitor and improve system performance and population health outcomes. Ideal systems have the capability for multi-level analyses at patient, system, and population levels, and information technology infrastructure that is linked to associated workflows and a supportive practice culture. Although PRO-enabled feed-forward data systems have great promise to improve outcomes, substantive empirical evidence supporting this needs to be established through comprehensive research. However, there is early supportive evidence demonstrated through Lindblad et al.’s work,<sup>1</sup> as well as by Beach et al.,<sup>2</sup> Foulberg et al.,<sup>3</sup> Govindan et al.,<sup>4</sup> Harbluk et al.,<sup>5</sup> O’Connell et al.,<sup>6</sup> Watson,<sup>7a</sup> Wasson et al.,<sup>8,10</sup> and Wolfe et al.<sup>11</sup>

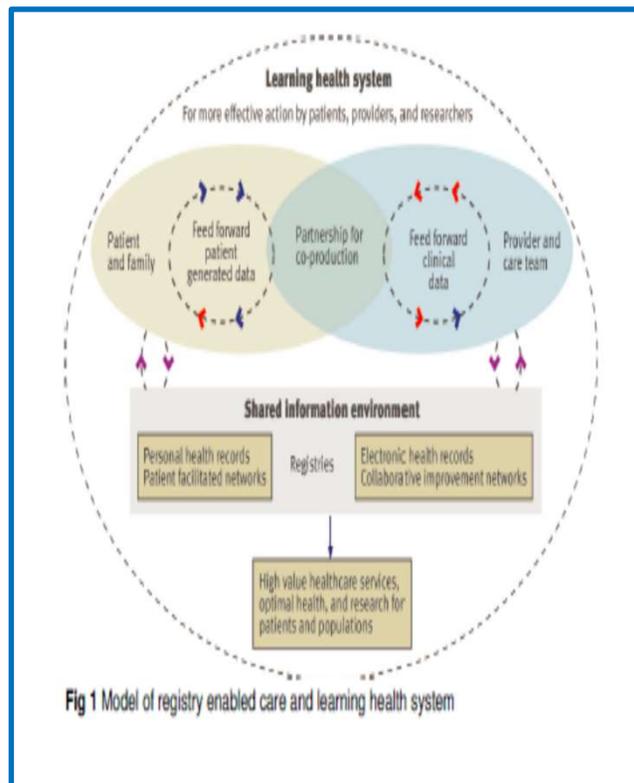

Fig 1 Model of registry enabled care and learning health system

## LHS Components:

- Registry
- Feed-forward information
- Feedback information
- PRO, PROM, PREM data
- Clinical data
- Qualitative data

<https://pubmed.ncbi.nlm.nih.gov/30985594/>

<https://www.bmj.com/content/354/bmj.i3319>

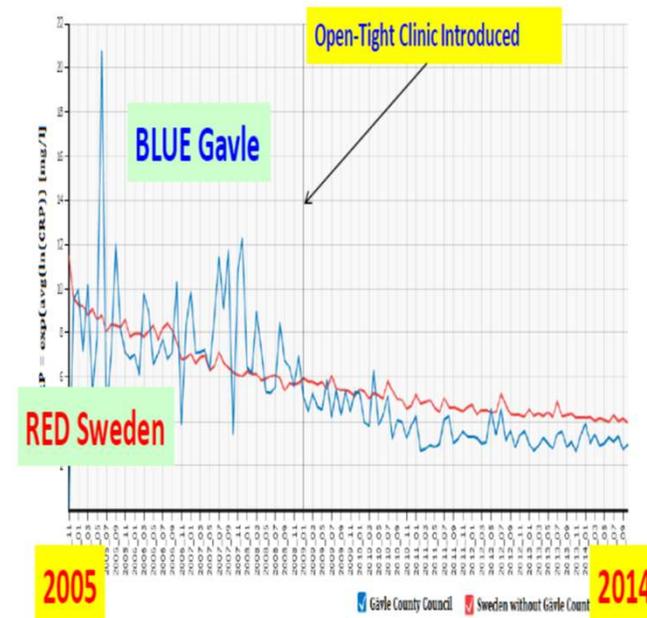

## LHS Potential

- There is **precedent for LHS improvement** approaches in other complex, costly, chronic disease populations.
- In Sweden, a national-level LHS initiative using feed-forward PRO data to risk stratify **rheumatoid arthritis** population resulted in improved disease control and improved access to care (Lindblad et al., 2014).<sup>1</sup>
- In the United States, a randomized prospective study of 766 oncology patients demonstrated **improved life expectancy** in patients engaged in care using a PRO-based LHS approach (Basch et al., 2017).<sup>2</sup>

**Accelerating the rate of improvement in cystic fibrosis care: contributions and insights of the learning and leadership collaborative**

Marjorie M Godfrey,<sup>1</sup> Brant J Oliver<sup>2</sup>

The Dartmouth Institute for Health Policy and Clinical Practice, Geisel School of Medicine at Dartmouth, Lebanon, New Hampshire, USA  
1. [marjorie.godfrey@dartmouth.edu](mailto:marjorie.godfrey@dartmouth.edu)  
2. [brant.j.oliver@dartmouth.edu](mailto:brant.j.oliver@dartmouth.edu)

**ABSTRACT**

**Introduction** The Learning and Leadership Collaborative (LLC) supports cystic fibrosis (CF) centres' responses to the variation in CF outcomes in the USA. Between 2002 and 2013, the Cystic Fibrosis Foundation (CFF) designed, tested and modified the LLC to guide front line staff efforts in these efforts. This paper describes the CFF LLC evolution and essential elements that have facilitated increased improvement capability of CF centres and improved CF outcomes.

**Methods** CF centre improvement teams across the USA have participated in 11 LLCs of 12 months' duration since 2002. Based on the Dartmouth Microsystem Improvement Curriculum, the original LLC included face to face meetings, an email listserv, conference calls and completion of between learning session task books. The LLCs evolved over time to include internet based learning, an electronic repository of improvement resources and examples, change ideas driven by evidence based clinical practice guidelines, benchmarking site visits, an applied QI measurement curriculum and team coaching.

**Results** Over 90% of the CF centres in the USA have participated in the LLCs and have increased their improvement capabilities. Ten essential elements were identified as contributors to the successful LLCs: LLC national leadership and coordination, local leadership, people with CF and families involvement, registry data transparency, standardised improvement curriculum with evidence based change ideas, internet resources with reminders, team coaching, regular progress reporting and tracking, benchmarking site visits and applied improvement measurement.

**Conclusions** The LLCs have contributed to improved medical and process outcomes over the past 10 years. Ten essential elements of the LLCs may benefit improvement efforts in other chronic care populations and health systems.

**INTRODUCTION**

The Learning and Leadership Collaborative (LLC) supports cystic fibrosis (CF) centres' responses to the variation in CF outcomes in the USA.<sup>1</sup> Between 2002 and 2013, the Cystic Fibrosis Foundation (CFF) designed, tested and modified the LLC to guide front line staff efforts in these efforts. We report here the implementation and outcomes of 11 sequential CFF supported improvement collaboratives that involved over 90% of the US CF care centres during this 10 year period. We include essential elements to consider in designing, executing and assessing improvement collaboratives.

**METHODS**

Leading improvement in CF centres at a national level across the USA posed unique challenges. Each CF centre had its own local culture, patient population and interprofessional staff, and was influenced by the larger healthcare system in which it existed. It was critical to identify an improvement programme and process that could be adapted to suit the complex CF community broadly and each specific CF centre. A variety of healthcare improvement methods were considered, and after an early sampling of three improvement methodologies, the CFF leadership adopted the Dartmouth Clinical Microsystem applied theory and curriculum.<sup>2-3</sup> The rationale for this selection was based on the practicality, feasibility, adaptability and applicability of the Dartmouth curriculum for busy novice improvers in a variety of contextual settings.

## System-Level Variation in Multiple Sclerosis Care Outcomes: Initial Findings from the Multiple Sclerosis Continuous Quality Improvement Research Collaborative

Brant J. Oliver, PhD, MS, MPH, APRN-BC, MScN;<sup>1-4</sup> Karen Walsh, DSc, MS, MBA;<sup>5</sup> Randall Messier, MT, MSA, PCMH CCE;<sup>6</sup> Faiguni Mehta, MS, MBA, OPHQ, CPPS;<sup>1</sup> Ann Cabot, DO;<sup>7</sup> Eric Klawns, MD, MSc;<sup>7</sup> Patricia Pagnotta, MSN, APRN-BC, MScN;<sup>8</sup> Andrew Solomon, MD;<sup>9</sup> and Sarah E. England, PhD;<sup>10</sup> for the MS-CQI Investigators

**Abstract**

Multiple sclerosis (MS) is a “3C” (complex, chronic, costly) condition that is a common and disabling neurological illness affecting approximately 1 million adults in the United States. MS has been studied at the basic science, individual, and population levels, but not at the system level to assess small-area variation effects on MS population health outcomes. System-level effects have been observed in other 3C conditions including cystic fibrosis, rheumatoid arthritis, and inflammatory bowel disease. The authors report here on system-level variation findings from the baseline period during the first year of the Multiple Sclerosis Continuous Quality Improvement (MS-CQI) study. Stepwise binary logistic regression analyses were conducted to investigate system-level (small-area variation) effects on MS relapses (exacerbations), disease-modifying therapy (DMT) utilization, and brain MRI utilization, controlling for demographics (age and sex) and other potential confounders. Significant differences were observed in people with MS (PwMS) between centers for a number of demographic and disease characteristics, including sex, age, and MS subtype. Controlling for these factors, significant system-level effects were observed on outcomes, including DMT utilization, MRI utilization, and relapses. Significant relationships also were observed between outcomes and urgent care utilization, including emergency department visits and hospitalizations. This initial study provides evidence establishing the presence of system-level variation effects on MS outcomes in a multicenter population study – where PwMS get their care can influence their outcomes. Results support continued systems-level research and improvement initiatives to optimize MS population health outcomes in this challenging and costly complex chronic condition.

# Experience of Multiple Sclerosis Centers Participating in the Multiple Sclerosis Continuous Quality Improvement (MS-CQI) Collaborative: A Qualitative Study

*Alexander C,<sup>1</sup> Hakim H,<sup>1</sup> Mehta F,<sup>1</sup> Oliver BJ,<sup>1-3</sup> for the MS-CQI Investigators*

<sup>1</sup> Department of Community & Family Medicine, Dartmouth-Hitchcock Health, Lebanon, NH; <sup>2</sup> Department of Psychiatry, Geisel School of Medicine at Dartmouth, Hanover, NH; <sup>3</sup> the Dartmouth Institute for Health Policy & Clinical Practice, Geisel School of Medicine at Dartmouth, Hanover, NH

*Drs. Alexander and Hakim were DNP prepared post-doctoral fellows*

**MS-CQI COLLABORATIVE**  
IMPROVING MS CARE TOGETHER

# Methods

- This cross-sectional qualitative study explored the factors that either helped or hindered successful CQI in 4 MS-CQI centers: The four factors studied included leadership, resiliency, burnout, and COVID-19.
- A purposive sample of eight participants were selected.
- Participants were recruited through the four MS centers who participated in the MS-CQI study.

This qualitative study was nested underneath the core MS-CQI study...

# Results

## Leadership

- **Collaboration** and **leader attributes** are key

## Burnout

- Participation in QI was found to be a **protective mechanism** against burnout (creating hope for the future).

## Resiliency

- Working in a team (**collaborating**) created higher levels of resiliency.

## COVID Impact

- **Telemedicine** visits during the pandemic had a **modifying effect of CQI efforts.**

## Identified Key Leader *Attributes* and *Barriers*

### Attributes

Active listener

QI knowledge

Fair-minded

Coach

Engage with team

### Barriers

Resistance to change

Lack of trust

Lack of flexibility

Poor listening skills

# Burnout: QI as Protective Mechanism

## Key Attributes

Work as a Team

Hope

“Leaders can get people excited about participation in QI. Makes things better, creates **hope for future**”

“QI adds a protective layer. **People get excited.** Everyone is working as a team, strategizing problems.”

“QI done right is a **protective mechanism**”

QI can be overwhelming, but if it **(QI) is successful**, burnout does not occur”

## Resiliency: Collaboration + Engagement

### Key Attributes

#### Teamwork

“Collaborative improved the way we were seeing **patients-you are actively thinking about how to do things better**”

“**Staff feel invested**, feel like they are making a difference and when you feel fulfilled you feel happy at your job”

“Improving **cohesiveness of group leads to better understanding and how people can work together.**”

“**Staff are so much happier when they feel part of a team.**”

“When they are engaged in a study like this they feel like they are **part of something bigger, it makes sense to them**”

## Flexibility during the pandemic...

IMPROVING MS CARE TOGETHER

**Table 3. Utilization by Visit Type for Rural vs. Urban Centers (Q11 & Q12)**

Characteristics	Rural (CH, UVM) <i>Frequency (%)</i>	Urban (Orlando, MGH) <i>Frequency (%)</i> †
Proportion of patients that had an In-person Visit	584 (49.03%)	305 (45%)
Proportion of patients that had a Telephone Visit	458 (38.46%)	64 (9%)
Proportion of patients that had a Televideo Visit	299 (25.10%)	207 (31%)
<b>Total</b>	<b>1191 (100%)</b>	<b>675 (100%)</b>

**Table 4. Utilization by Visit Type for Academic vs. Non-Academic Centers (Q11 & Q12)**

Characteristics	Academic (MGH, UVM) <i>Frequency (%)</i>	Non-Academic (Concord, Orlando) <i>Frequency (%)</i> †
Proportion of patients that had an In-person Visit	287 (49.83%)	602 (46.67%)
Proportion of patients that had a Telephone Visit	73 (12.67%)	449 (34.81%)
Proportion of patients that had a Televideo Visit	263 (45.66%)	243 (18.84%)
<b>Total</b>	<b>576 (100%)</b>	<b>1290 (100%)</b>

Table 3 and 4. Results from all MS outpatient clinical encounters from Electronic Health Records (EHRs) during Quarters 11 and 12. † Orlando did not conduct phone visits during the study period.

**Table 5. Adjusted Odds of Relapse-Free Status and DMT-Free Status by Visit Type (n=1,866)**

Predicting Relapse Free-Status Based on Visit Method	Odds Ratio	95% Confidence Interval	P-Value
In-Person Visit*	0.502	0.255-0.988	0.046
Telephone	0.416	0.141-1.222	0.111
Video*	0.453	0.217-0.944	0.035

Predicting DMT Free-Status Based on Visit Method	Odds Ratio	95% Confidence Interval	P-Value
In-Person Visit*	0.552	0.382-0.796	0.002
Telephone	0.743	0.493-1.119	0.155
Video*	0.526	0.346-0.800	0.003

# Breakout Questions

- 1) “*All models are wrong, some are useful*” – discuss how LHS thinking might change how you view opportunities for EBP, improvement, research, and health professions education.
- 2) How might LHS oriented activities help to promote clinical excellence and optimize outcomes in the setting of our current healthcare climate very challenging circumstances?
- 3) How could LHS approaches be used to reduce turnover, burnout, and moral injury in our healthcare environment?
- 4) What questions do you want to ask?

# A new equation...
